New: PRIAMUS opens training facility

In order to meet client requirements in the USA, Priamus System Technologies LLC opened a training facility in Brunswick, OH.

With the support of the injection molding machine manufacturer Arburg and Regloplas, a temperature controller manufacturer, PRIAMUS offers a training program which is based on three levels. Depending on the level, the training program is designed for all staff in an injection molding company, process technicians, tooling engineers, managers and executives. The objective is to teach basic knowledge as well as to show participants how to optimize production processes and how to save production costs.

Each level consists of a lecture and lab course. For that reason as well as for mold setups and system tests for clients, an electric Arburg injection molding machine of the latest generation is available.

PRIAMUS also offers tailor-made training programs for companies, organisations or universities. Thus individual client requirements can be met.

PRIAMUS develops and sells control and monitoring systems for quality assurance in injection molding. PRIAMUS is worldwide the only company that offers systems which do not only monitor the injection molding process but also control it intelligently. Besides, these products stand out for innovative solutions in cavity temperature and cavity pressure measuring technology.
