PRIAMUS FILLCONTROL: A new Era is beginning

The injection molding process is versatile and ranges from simple connectors that have to be completely filled to complex technical parts to be produced in a multi cavity hotrunner mold. For this reason, PRIAMUS has developed a (digital) state of the art platform which can be upgraded by a completely modular and flexible concept.

It doesn't matter if the injection molding process takes place in the lab or in manufacturing for complex parts in a multi cavity hotrunner mold, the platform FILLCONTROL offers always the right solution.

The modular designed BlueLine Hardware system consists of a central control unit – the BlueLine Core -, amplifiers and interface modules that can be clicked onto each other as required. Because of the modularity of the concept the ideal solution can be arranged any time.

- As large as required
- As inexpensive as possible
- As complex as required.

Only with a modular concept the cost can be adapted to the actual needs!
