

## Press Release

Schaffhausen (CH) / Salach (D), Oktober 2016

PRIAMUS HoT Box

Balance made for Production

Just on time for K'2016 PRIAMUS® provides a special offer for the balancing of multi cavity hot runner molds. Main component is the control system FILLCONTROL Control H which balances Multi Cavity Hot Runner Molds and which controls the melt flow in large molded parts fully automatic.

With this very effective and meanwhile widely spread procedure the settings of the hot runner nozzles are permanently adjusted depending on the actual melt flow in the cavity. In doing so unfilled parts in multi cavity molds are excluded and weld lines in large components are actively controlled, relocated and kept in position. This procedure is a precondition for the systematic reduction of cycle times in multi cavity molds.

HoT Box contains all components including Core, connecting cables, interfaces and BlueLine amplifiers for maximum 16 temperature and 4 pressure channels. With this setup all applications up to 16 cavities can be monitored and controlled.

The entire package is available for a period of 3 months – starting from October until December 2016. The savings compared to list price are more than 30 %.
